Sheet Optimising for custom workshops

The Lite Optimiser (LO) contains all the features of Magi-Cut Intro plus added saw transfer options. Suited for the smaller custom workshop, LO is intended for optimising cutting lists with high variety and low quantities and for cutting mostly single sheet patterns with a focus on material savings.

It may be used with a sliding table saw, a vertical panel saw or a small beam saw.

## Features and benefits

- Each part list can include a mix of parts of different materials with a maximum 10,000 pieces per optimisation
- Part requirements can be imported from CSV or text files, or copied and pasted from a spreadsheet.
- For each part you can specify the material type and grain direction, and also indicate if over production may be allowed.
- Download patterns to a Holzma saw with Cadmatic 4 controller.
- For each material a list of board sizes with stock availability will be extracted automatically from the board library.
- Optimising parameters let you define trims and saw kerf, and specify if cutting patterns with head cuts and multiple phase cuts are allowed.
- Fully configurable reports including management summary showing material usage, costs and wastage. Also summaries for parts produced, boards used, and patterns.

## Manufacture faster and more efficiently

“ We at SC Cabinets have been using Magi-Cut Lite for the best part of seven years and can safely say it has transformed our company by allowing us to manufacture faster and more efficiently. Wonderful piece of software. ”

Sam Cooper - S C Cabinets
