# Stock Control

For accurate and efficient inventory management

This invaluable module protects your profit margin by minimising downtime due to lack of stock. The SC module helps you accurately track your raw materials, adding off-cuts back to stock so that no reusable material is wasted - and you can allocate sheets to jobs in advance so that you don't optimise the same off-cut on different jobs.

Highlights

> The program helps you check stock levels, record raw material orders and book in receipts from your supplier.

> The optimiser considers available free stock (physical stock less allocations) and automatically adjusts stock after cutting.

> Configurable reports include stock valuation, minimum stock levels, monthly summary of stock usage and an audit trail of all stock movements.

> It automatically updates both core material and laminate stock, when you laminate full sheets prior to cutting.

> Physical stock control of hardware and edge banding material when used with product and quotes module.

> Interface to automatic storage handling systems for synchronization of full sheet and off-cut stock via SQL Server database.

Configureable stock reports

All the stock reports allow you to configure them to your exact needs.

You can tailor each report to include just the columns you need; the font and size, field length and so on with separate format for display and printed versions.

Also you can export the contents of each report to an ASCII CSV file, and again choose which items are exported, ready for further analysis in Excel or other applications.
